If you like & use my models please consider supporting my efforts with the button below. Thank you!

...Please at least be sure to hit like & post a make, I'd love to see your prints!

Use volcano nozzles in your sv06 plus.

DONT LEAVE A BAD REVIEW BECAUSE YOU DID A BAD PRINT! Like the single reviewer here! That's just not cool.

It's basically just meant to be a quick & simple no-frills stock unit replacement to allow you to install & use regular volcano nozzles. It's meant to just get you printing with the new nozzle type, please don't expect upgrade miracles.

Print standing upright on its flat nozzle-side face. Use petg 0.2-0.3mm layer height. No supports required.
Once printed. Replace stock fan duct

Add volcano nozzle, fit silicone sock after slightly trimming back the height of the nozzle opening - not too much!!

You will need to adjust the probe in the holder upwards to set your new Z offset correctly - check YouTube for setting inductive probe height.
